

Test Case Report

Offer Name: tesr
Tested URL: https://blowoutcartexpress.com/vizioclass4ksmarttv?affid=1&click_id=testingcc&state=CA
Test Date: 2026-04-04 02:53:26
Tested By: Automated Order Flow Runner
Overall Result: FAIL
Report ID: ofr_20260403_232202_331ffe91

Credentials

Browser: msedge
Execution Type: Order Flow Automation
Total Rows: 1

Product Map

Primary Offer: tesr
Landing URL: https://blowoutcartexpress.com/vizioclass4ksmarttv?affid=1&click_id=testingcc&state=CA
Report Artifact: HTML

Client Requirements

Checkout should load correctly, card information should be entered successfully, and each row should record the final order outcome.
Required output fields retained in this report: Order ID, Result, Status, Card Type, Card Last 4, and Notes.

Desktop and Mobile

This report captures automated checkout execution results. Mobile-specific layout validation is not part of this order-flow run unless separately configured.

Usability

Checkout readiness, popup interruption handling, and form completion behavior were evaluated during the automated run.

Tested Rows

Row	Email	Order ID	Result	Status	Card Type	Card Last 4	Notes

ALPN extension is supported.

KeyCDN is a content delivery network that will supercharge your web assets.

HTTP/2 Test FAQ

What is HTTP/2?

HTTP/2 is the first major HTTP protocol update since 1989 when HTTP/1.1 was first published by the IETF. The new HTTP protocol is needed to keep up with the exponential growth of the web. The successor of HTTP/1.1 brings significant improvement in efficiency, speed and security and is supported by most modern web browsers. A list of browsers that support HTTP/2 can be found on [caniuse.com](#).

- HTTP/2 is binary, instead of textual.
- It is fully multiplexed, sending multiple requests in parallel over a single TCP connection.
- It uses header compression (HPACK) to reduce overhead.
- It allows servers to "push" responses proactively into client caches instead of waiting for a new request for each resource.
- It uses the new ALPN extension which allows for faster encrypted connections since the application protocol is determined during the initial connection.
- It reduces additional round trip times (RTT), making your website load faster without any optimization.
- Domain sharding and asset concatenation is no longer needed with HTTP/2.

Does this test also verify SPDY?

Not directly, but it tests which TLS extension is supported to negotiate the protocols. The tested TLS extensions are either HTTP or ALPN. Basic Protocol Negotiation (BPN) appeared as part of the SPDY protocol but it has been deprecated. Application Layer Protocol Negotiation (ALPN) is the successor of BPN and is approved by the IETF (RFC7540). However, NPN advertises the supported protocols from the server to the client and this test will allow the advertised protocols if HTTP/2 is not supported. The protocol advertising has been removed in ALPN (client to server). The first phase of this HTTP/2 check runs the ALPN test with only TLS in the protocol list.

How to test HTTP/2 via command line?

Get the latest curl release and use this command: curl -v --http2

HTTP/2 introduces other improvements, more details: [HTTP/2 RFC7540](#)

This test can check HTTP and HTTPS but most browsers only support HTTP/2 for HTTPS, which means you must migrate to HTTPS if you want to take advantage of the performance benefits.
